## Parker Christenson Assignment 6

## Anomaly Detection with a Deep Autoencoder

## Instructions

- 1. Download the Credit Card Fraud Detection dataset by completing the steps below, and preprocess it as needed for training the deep autoencoder.
- 2. Go to https://www.kaggle.com/datasets/mlg-ulb/creditcardfraudLinks to an external site. and try to download the dataset.
  - If you don't have access to the dataset, create an account in Kaggle.
  - Once you are logged in, search for "Credit Card Fraud Detection" in the search bar at the top of the page.
  - On the dataset page, click the "Download" button to download the dataset in CSV format.
- 3. Split the dataset into training, validation, and testing sets.
- 4. Design and train a deep autoencoder with multiple layers to encode the input data and decode it back to its original form.
- 5. Use the trained autoencoder to detect anomalies in the test set by comparing the input and output data and calculating reconstruction error.
- 6. Evaluate the performance of the autoencoder by measuring the accuracy, precision, recall, and F1 score of the anomaly detection.
- 7. Discuss the limitations and potential applications of deep autoencoders for anomaly detection in credit card transactions and other domains.
